                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides new DNA molecules (AAX60773-X60781) encoding soybean cytochrome P450 enzymes (AAX09183-Y09191) respectively. The DNA encoding the cytochrome P450 enzymes is useful for transformation of Solanaceae crop plants. Transgenic plants comprising DNA constructs having the P450 encoding nucleic acid sequences are resistant to phenylurea herbicides. The transgenic plants have increased resistance to phenylurea herbicides compared to wild-type plants of the same species. The plant crops, e.g. turfgrass, tobacco, potato, tomato, corn, rice, cotton, soybean, rape, wheat, oats, barley or rice are particularly resistant to fluometuron, linuron, chlortoluron or diuron

The polymuclectide sequences given in AAA26281 to AAA26336 encode the human secreted proteins given in AAY91346 to AAY91449. The human secreted proteins given in AAY91346 to AAY91449. The human secreted proteins given in AAY91346 to AAY91449. The human secreted corrections can have activities based on the tissues and cells they are expressed in. Examples of the activities are: neuroprotective, nootropic, neuroleptic; antimanic; cerebroprotective; immunomodulatory; anti-corrections and vasotropic. The polymucleotides and proteins may be used to prevent, treat or ameliorate a medical condition, e.g. by protein correction repeated to proteins of the invention include neural, reproductive, or immunodeficiency, infection, lymphomas, demyelinating diseases, auto-include neural, reproductive, or immunodeficiency, inflammation, aneurysms and haemorrhages. Specific examples include: Alzheimer's disease; compulsive disorder and viral prophylaxis. The polymucleotides and proteins can also be used in the detection of disorders associated with the function of the protein, for example, the detection of developmental disorders, sexually-linked disorders, mania; proteins can also be used in the detection of developmental consorders, sexually-linked disorders, or disorders of the cardiovascular system. They may also be used as food additives or preservatives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
Novel secreted proteins and corresponding DNA molecules that can be used to prevent, treat and diagnose disease in humans, for example, Alzheimer's, cancer, and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;

HLA-A26 decamer #423

```
The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 IBI (CYDIBI), which involves administering to the patient a cytocoxic T-lymphocyte complex kills the cell, an antigen presenting cell (APC) that cell, an antigen presenting cell (APC) that cell, an antigen presenting cell (APC) that cerivates CTL, a peptide of CYPIBI that binds to major histocompatibility complex (MFC) molecule, or a nucleic acid molecule encoding CYPIBI or peptide of CYPIBI or a peptide of CYPIBI that binds to method for assessing the level of immunity of a patient to CYPIBI or a peptide of CYPIBI that binds to mic complex molecule, involving measuring the level of CTL specific for CYPIBI or the peptide of CYPIBI in a sample from the patient or specific of a MFC complex molecule, (I) that binds to MFC complex molecule, (3) an exvivo generated CTL (II) that specifically kills a cell expressing CYPIBI or a specific of a MFC complex-restricted feashon; and (4) an exvivo generated APC (III) that presents a peptide of a CYPIBI in the context of a wHC complex molecule. The method is useful for treating a patient is useful for the prevention, treatment and diagnosis of cancer, e.g. melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and brain cancer. AAN06905 to AAM1366 represent CYPIBI peptides which can brain cancer and not the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating a cancer patient involves administering to patient a cytotoxic T-lymphocyte, an antigen presenting cell that activates T cells, a peptide of cytochrome P450 1B1, or a polynucleotide encoding the peptide.
                                                                                                                                                                                                     Cytochrome P450 1B1; CYP1B1; cancer; immunotherapy; diagnosis; HLA; human leukcoyte antigen; cytocoxic T-lymphocyte; CT1, MHC; APC; major histocompatibility complex; antigen presenting cell; melanoma; lymphoma; carcinoma; sarcoma; multiple myeloma; leukaemia.

Treating a cancer patient involves administering to patient a cytotoxic T -lymphocyte, an antigen presenting cell that activates T cells, a peptide of cytochrome P450 1B1, or a polynucleotide encoding the peptide.

The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 1B1 (CYP1B1), which involves administering to the patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an antigen presenting cell (APC) that cerivates CTL, a peptide of CYP1B1 that binds to major histocompatibility complex (MHC) molecule, or a nucleic acid molecule encoding CYP1B1 or complex (MHC) molecule, or a nucleic acid molecule encoding CYP1B1 or complex (MHC) molecule, no a patient to CYP1B1 or a peptide of CYP1B1 that level of immunity of a patient to CYP1B1 or a peptide of CYP1B1 that binds to MHC complex molecule, involving measuring the level of CTL specific for CYP1B1 or the peptide of CYP1B1 in a sample from the patient; (1) a cyP1B1 peptide (1) that binds to MHC complex molecule; (3) an exvivo generated APC (III) that specifically kills a cell expressing CYP1B1 in a specific of a MHC complex-restricted fashion; and (4) an exvivo generated APC (III) that presents a peptide of a CYP1B1 in the context of a MHC complex molecule. The method is useful for treating a patient having or is at risk of having a cell that expresses CYP1B1. The method is useful for the prevention, treatment and diagnosis of cancer, e.g.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and lung, ovarian, uterine, cervical, prostate, liver, colon, pancreatic and brain cancer. Amolegos to Amilisce represent CYPIBI peptides which can bind to human leukcoyte antigens (HLAB), as well as other amino acid sequence used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 1B1 (CYPIB1), that with involves administering to the patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an antigen presenting cell (APC) that activates CTL, a peptide of CYPIB1 that binds to major histocompatibility complex (MMC) molecule, or a nucleic acid molecule encoding CYPIB1 or peptide of CYPIB1. Also described are: (1) a method for assessing the cell evel of immunity of a patient to CYPIB1 or a peptide of CYPIB1 that binds no append of CYPIB1 that binds to MHC complex molecule, involving measuring the level of CTL specific for CYPIB1 peptide of CYPIB1 in a sample from the patient complex molecule. (2) a CYPIB1 peptide (1) that binds to MHC complex molecule, (3) an exvivo generated APC (III) that specifically kills a cell expressing CYPIB1 complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient complex molecule. The method is useful for the prevention, treatment and diagnosis of cancer. e.g. melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and clung, ovazian, uterine, cervical, prostate, liver, colon, panceratic and colon, pancer colon, pancer colon, pancer colon, pancer colon, pancer colon, pancer amino acid bind to human leukocyte antigens (HIAs), as well as other amino acid colon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating a cancer patient involves administering to patient a cytotoxic T-lymphocyte, an antigen presenting cell that activates T cells, a peptide of cytochrome P450 1B1, or a polynucleotide encoding the peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytochrome P450 1B1; CYP1B1; cancer; immunotherapy; diagnosis; HLA; human leukocyte antigen; cytotoxic T-lymphocyte; CTL; MHC; APC; major histocompatibility complex; antigen presenting cell; melanoma; lymphoma; carcinoma; sarcoma; multiple myeloma; leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nadler LM, Maecker

```
The present invention describes a method for treating a patient having, or is at risk of having, a cell expressing cytochrome P450 IB1 (CYPIB1), which involves administering to the patient a cytocoxic T-lymphocyte (CTL) that kills the cell, an antique presenting cell (APC) that activates CTL, a peptide of CYPIB1 that binds to major histocompatibility complex (MMC) molecule, or a nucleic acid molecule encoding CYPIB1 or peptide of CYPIB1. Also described are: (1) a method for assessing the level of immunity of a patient to CYPIB1 or a peptide of CYPIB1 that binds to MHC complex molecule, involving measuring the level of CTL specific for CYPIB1 peptide (I) that binds to MHC complex molecule, involving measuring the level of CTL specific for CYPIB1 peptide (I) that binds to MHC complex molecule; (3) an exvivo specific of a MHC complex restricted fashion; and (4) an exvivo cyvivo generated APC (III) that presents a peptide of a CYPIB1 in the context of a MHC complex molecule. The method is useful for treating a patient complex molecule. The method is useful for treating a patient of is useful for the prevention, treatment and diagnosis of cancer, e.g. melanoma, lymphoma, carcinoma, sarcoma, multiple myeloma, leukemia, and clumg, ovarian, uterine, cervical, prostate, liver, colon, pancreatic and chain cancer. AAM06905 to AAM3356 represent CYPIB1 peptides which can bind to human leukocyte antigens (HLAs), as well as other amino acid sequence used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating a cancer patient involves administering to patient a cytotoxic -lymphocyte, an antigen presenting cell that activates T cells, a peptid of cytochrome P450 1B1, or a polynucleotide encoding the peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes an isolated nucleic acid molecule (I) tencoding human cytochrome P450, CYP 27C1, and a hybrid homologue from Xenopus laevis. (I) has thyromimetic, antidiabetic, cytostatic, antipsoriatic, tuberculostatic, osteopathic, dermatological and antilipaemic activities, and can be used in gene therapy and in vaccines. The nucleic acid molecules, proteins and methods from the present invention are useful for treating diseases related to vitamin D or vitamin D metabolite deficiency, e.g. hyper- and hypo-parathyroidism, oscondary hyperparathyroidism, diabetes, medullary carcinoma, psoriasis, asrcoidosis, tuberculosis, chronic renal disease, hypophosphatemic VDRK, vitamin D dependent rickets, anticonvulsant treatment, fibrogenesis imperfects ossium, osteltitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecules encoding cytochrome P450 proteins, human CYP 27C1 and a hybrid homologs from Xenopus laevis, useful for treating diseases related to vitamin D or vitamin D metabolite deficiency, e.g. parathyroidism and diabetes.
                                                                                                                                                                                                                                                                                                              Conserved haem region generic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  'note= "unspecified"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 'note= "unspecified"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               'note= "unspecified"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an isolated nucleic acid molecule (I) encoding human cytochrome P450, CYP 27C1, and a hybrid homologue from encoding human cytochrome P450, CYP 27C1, and a hybrid homologue from the schopus lavevis. (I) has thyrominetic, antidiabetic, cytostatic, antipocriatic, tuberculostatic, osteopathic, dermatological and antilipaemic activities, and can be used in gene therapy and in vaccines. The nucleic acid molecules, proteins and methods from the present invention are useful for treating diseases related to vitamin D netabolite deficiency, e.g. hyper- and hypo-parathyroidism, Osudohypo-parathyroidism, Secondary hyperparathyroidism, diabetes, medullary carcinoma, psoriasis, sarcoidosis, tuberculosis, chronic renal disease, hypophosphatemic VDRR, vitamin D dependent rickets, anticonvilant treatment, fibrogenesis imperfecta ossium, osteititis fibrosa cystica, osteomalacia, osteoporosis, osteopaenia, osteopsclerosis,
hypercalcaemia, malabsorption syndrome, steatorrhoea, and tropical sprue, or cholesterol, steroid and other lipid metabolic disorders. The present sequence represents a conserved haem region generic peptide, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid molecules encoding cytochrome P450 proteins, human CYP 27C1 and a hybrid homologs from Xenopus laevis, useful for treating diseases related to vitamin D or vitamin D metabolite deficiency, e.g. parathyroidism and diabetes.
                                                                                                                                                                                             Gaps

Host cells comprising the sequences of the invention are useful for making one or more enzymes from the metabolic pathway for the synthesis of sitosterol to eplerenone. They are useful for selective oxidation of a compound to an hydroxylated product. Compositions of the invention are useful for producing spores

from A. ochraceus, A. niger, A. nidulans, Rhizopus oryzae, R. stolonifer, R. arrhizus Trichothecium roseum, Fusarium oxysporum and M. olivaceum etc., preferably to produce spores from A. ochraceus. Sequences of the invention are useful in bioconversion of steroid substances to their 11 alpha-hydroxy counterparts. They are also used in cell therapy. The present sequence is A. ochraceus cytochrome p450 conserved haem binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the isolation of cotton (+)-delta-cadinene 8-hydroxylase (designated as CYP706B1), and the polynuclectide sequence encoding it. The CYP706B1 protein is a cytochrome P450 which is useful as a target for suppression of the biosynthesis of gossypol and related sesquiterpenes in cotton seeds through genetic engineering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel cotton (+)-gamma-cadinene 8-hydroxylase polypeptide designated as CYP706B1, useful as target for suppression of biosynthesis of gossypol formation in cotton seeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            biosynthesis of gossypol; sesquiterpene; cotton seed; cotton cultivate; sesquiterpenoid; livestock feed; monooxygenase; haem-binding motif.

techniques. The polymucleotide sequence encoding CYP706B1 is useful in suppression of the biosynthesis of gossypol and related sesquiterpenes in cotton seeds, where the polymucleotide sequence is expressed in antisense or sense orientation as a perfect match to the native gene whose or sense orientation as a perfect match to the native gene whose invention is suggit to be suppressed. The polymucleotide sequence of the invention is useful for producing cotton cultivates which avoid the presence of sesquiterpenoids in their seeds, and for producing cotton humans. The present sequence represents a highly conserved haem-binding motif found in eukaryotic P450 monooxygenases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New Rhodococcus ruber nucleic acid, useful for transforming bacteria for depolluting soil contaminated with ethyl tert-butyl ether comprises the cytochrome P-450 gene cluster involved in cleavage of ethyl tert-butyl

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to retinoic acid metabolising cytochrome P450, P450RAI polypeptides and polynucleotides. Methods and compositions of the invention are useful for diagnosing, preventing, ameliorating and/or treating disorders associated with the aberrant expression or activity of the P450RAI such as diseases related to vitamin A and retinoic acid metabolism, e.g. cancer, actinic keratosis, psoriasts, acme and ichthyosis. The invention is useful in gene therapy and as vaccine. The present sequence is cytochrome P450 putative family signature peptide.
of Rhodococcus ruber strain CNCM I-1889 cells. EthB is an ethyl textbutyl ether (ETBB)-induced cytochrome P450. It forms part of a cytochrome P450 system involved in the cleavage of ether fuel additives. Recombinant host cells comprising a vector encoding eth genes, and which are capable of ETBE degradation or mineralization, can be used for bloremediation of a contaminated soil or effluent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated P450RAI-3 nucleic acid molecule and polypeptide, useful for diagnosing, preventing, or treating disorders with aberrant expression or activity of the P450RAI-3, such as cancer, actinic keratosis, acne and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

enzyme.

```
The polypeptide of the invention demonstrates antipsoriatic and osteopathic activities and may be useful for identifying compounds which modulate the activity or inhibit the expression of vitamin-D3 hydroxylase and thus for treating or preventing hypercalcaemia. Furthermore, the polypeptide may be utilised during gene and antisense therapy, as well as for treating activated vitamin-D3 deficiency disorders such as hypoparathyroidism, rickets, psoriasis, osteoporosis and renal insufficiency. The current sequence is that of the peptide 1 of the invention which is related to human vitamin-D3 hydroxylase.
                                                                                                           vitamin-D3 hydroxylase; VDDH; antipsoriatic; osteopathic; hypercalcaemia; gene therapy; antisense; hypoparathyroidism; rickets; psoriasis; osteoporosis; renal insufficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           vel vitamin-D3 hydroxylase protein, useful for identifying modulators the vitamin-D3 hydroxylation activity of the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel vitamin-D3 hydroxylase (VDDH) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ecdysteroid synthesis inhibitor; insecticidal; cytochrome P450; haem ligand motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 10;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to retinoic acid metabolising cytochrome P450, P450RAI polypeptides and polymucleotides. Methods and compositions of the invention are useful for diagnosing, preventing, ameliorating and/or treating disorders associated with the aberrant expression or activity of the P450RAI such as diseases related to vitamin A and retinoic acid metabolism, e.g. cancer, actinic keratosis, psoriasis, acne and ichthyosis. The invention is useful in gene therapy and as vaccine. The present sequence is cytochrome P450 putative family signature peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated P450RAI-3 nucleic acid molecule and polypeptide, useful for diagnosing, preventing, or treating disorders with aberrant expression or activity of the P450RAI-3, such as cancer, actinic keratosis, acne and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention relates to genes, proteins and methods comprising carotemoid monoxygenases in the cytochrome P450 family. The invention also relates to altering carotemoid ratios in plants and microorganisms using LUT1 epsilon-hydroxylases and/or CYP97A beta-hydroxylases. The invention is useful in altering the carotemoid production in a plant for enhancing production of specific carotemoid compounds that are potent antioxidants. The present sequence is thale cress LUT1 cytochrome P450 monooxygenase cysteine motif peptide.
                                                                                                                                                a nucleic acid sequence encoding a P450 activity, useful in altering the for enhancing production of specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Xaa may be any naturally occurring amino acid"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        "Xaa may be any naturally occurring amino acid"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ecdysteroid synthesis comprising contacting an ecdysteroid biosynthetic enzyme with a candidate inhibitor molecule and determining whether or not said inhibitor inhibits enzymatic activity. The enzyme comprises a novel 1solated polypeptide of CYP302a1, CYP306a1, CYP307a1, CYP314a1 or CYP315a1. The method of the invention may be useful for determining whether or not a molecule has insecticidal properties and for making inhibitors of ecdysteroid synthesis. The current sequence is that of the cytochrome P450 haem ligand signature motif peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LUT1 cytochrome P450 monooxygenase cysteine motif peptide, SEQ ID NO: 15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention relates to a novel method for identifying inhibitors of

cytochrome P450 homologues pCGP142 and pCGP147 was used to design synthetic PCR primers. The primers may be used in PCR for amplification of petal cytochrome P450 homologues. See also AAR30868-75. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid sequence encoding a di:hydro:kaempferol-hydroxylating enzyme - e.g. cytochrome P450 introduced into transgenic plants for controlling flavonoid pigmentation in plants and organisms.
                                                                                 The present invention relates to genes, proteins and methods comprising carotenoid monooxygenases in the cytochrome P450 family. The invention also relates to altering carotenoid ratios in plants and microorganisms using LuTI epsilon-hydroxylases and/or CYP97A beta-hydroxylases. The invention is useful in altering the carotenoid production in a plant for enhancing production of specific carotenoid compounds that are potent antioxidants. The present sequence is a cytochrome P450 monooxygenase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The consensus sequence of haem-binding domains for advocado and petunia
                 the
   New expression vector comprising a nucleic acid sequence encoding a polypeptide having monooxygenase P450 activity, useful in altering the carotenoid production in a plant for enhancing production of specific carotenoid compounds.
                                                                                                                                                                                                                                         Gaps

The sequences were amplified using primers (AAQ47843-70). Related single specific primers using a gene sequence coding for the haem-binding region of cytochrome P450 are shown in (AAQ47871-047903). (Updated on 25-WAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)

Insertion of the sequences (AAQ47840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacteratium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQ47843-70). Related single specific primers using a gene sequence coding for the haem-binding region of cytochrome P450 are shown in (AAQ47871-Q47903). (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Insertion of the sequences (AAQA1840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacterium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQA1842-70). Related single specific primers using a gene sequence coding for the haem-binding region of cyclochome PASO are shown in (AAQ47871-Q47903).                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                           Insertion of the sequences (AAQ47840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacteratium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQ47843-70). Related single specific primers using a gene sequence coding for the haem-binding region of cytochrome P450 are shown in (AAQ47871-047903). (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                      Gene coding for flavonoid-3',5'-hydroxylase of petunia petals - used to transform plants e.g. petunia, rose or tobacco to give bluer flower colour and altered pigment pattern.
                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                            Insertion of the sequences (AAQ47840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacterium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQ47843-70). Related single specific primers using a gene sequence coding for the haem-binding region of cytochrome P450 are shown in (AAQ47871-047903). (Updated on 25-WAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Insertion of the sequences (AAQ47840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacterium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S

                                                                                        petunia, tobacco and carnation, using a suitable vector such as agrobacterium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQ47843-70). Related single specific primers using a gene sequence coding for the haem-binding region of cytochrome P450 are shown in (AAQ47871-Q47903). (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field),

```

```
Insertion of the sequences (AAQ47840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacterium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQ47843-70). Related single specific primers using a gene sequence coding for the haem-binding region of cytochrome P450 are shown in (AAQ47871-Q47903). (Updated on 25-WAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                            Gene coding for flavonoid-3',5'-hydroxylase of petunia petals - used to transform plants e.g. petunia, rose or tobacco to give bluer flower
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Flavonoid-3',5'-hydoxylase; transformation; plants; petunia; rose; tobacco; pigment alteration; blue; SSP; single specific primer; PCR; polymerase chain reaction; amplification; expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Insertion of the sequences (AAQ47840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacterizinm, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQ47843-70). Related single specific primers using a gene sequence coding for the haem-binding region of cytochrome P450 are shown in (AAQ47871-047903). (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)

in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQ47843-70). Related single specific primers using a gene sequence coding for the hame-binding region of cytochrome P450 are shown in (AAQ47871-Q47903). (Updated on 25-WAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Insertion of the sequences (AAQ47840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacterium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQ47843-70). Related shingle specific primers using a gene sequence coding for the haem-binding region of cytochrome P450 are shown in (AAQ4781-Q47903).                                                                                                                                                                             Insertion of the sequences (AAQ47840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacterium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQ47843-70). Related single specific primers using a gene sequence coding for the haem-binding region of cytochrome P450 are shown in (AAQ4781-Q47903). (Updated on 25-MAR-2003 to correct PN field.) (Updated

```
petunia, tobacco and carnation, using a suitable vector such as agrobacteratium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers shady and a single specific primers using a gene sequence coding for the haem-binding region of cytcohrome P450 are shown in (AAQ47871-Q47903). (Updated on 25-MAR-2003 to correct PN field.) (Updated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Insertion of the sequences (AAQ47840-42) into plants such as rose, petunia, tobacco and carnation, using a suitable vector such as agrobacteratium, give transformed plants which express the gene, resulting in petals with a bluer colour than normal, and/or pigmentation patterns which do not occur naturally. The sequences were amplified using primers (AAQ47843-70). Related single specific primers using a gene sequence coding for the hem-binding region of cytochrome P450 are shown in (AAQ47871-047903). The invention relates to a method of genetically transforming a plant simultaneously with multiple genes from the phenylpropanoid pathways, comprising incorporating into the genome of the plant, a number of genes, their substantially similar fragments or their combinations, to produce plants displaying alered agronomic traits. The genes are selected from commarate-CoA ligase (4CL), coniferyl aldehyde 5-hydroxylase (CAld5H), sedenosyl-L-methionine (SAM), dependent 5-hydroxyconiferaldehyde 0-methyltransferase (Ald6MT), coniferyl alcohol dehydrogenase (CAD) and sinapyl alcohol dehydrogenase (SAD). The method is useful for the composition of plant tissue for the alteration of lighin monomer composition, increased syringyl/guaiacyl (S/G) lighin ratio and increased cellulose content and transgenic plants resulting from such transformations. This is an improved method to simultaneously control the lighin quantity, lighin compositions, and cellulose contents in plants, and is applicable to all plant species that are susceptible to the transfer of genetic information by Agrobacterium or other gene delivery system. The method is of particular value to paper and pulp industries because lighin containing higher syringyl monomer content is more susceptible to chemical delighification. Woody plants transformed with the constructs offer a signification. Woody plants transformed with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     potential economic benefit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Genetically transforming plant with multiple genes from phenylpropanoid pathways, comprises incorporating number of genes into the genome of the plant, to produce plants displaying altered agronomic traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   process over conventional paper feedstocks. Similarly, modification of the lignin composition in grasses by insertion and expression of heterologous SAD gene offers a unique method for increasing the digestibility of grasses and is of significant potential economic benefit to the farm and agricultural industries. The present sequence represents the amino acid sequence of the conserved has—binding domain of P450 proteins, which has homology to CAldSH as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (UNMT ) UNIV MICHIGAN TECHNOLOGICAL,

The present peptide sequence of unknown function is given in the specification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tobacco; plant; cytochrome P450; disease resistance; biosynthesis; lipid; hormone; insect attractant; secondary metabolite; herbicide; pesticide; pollutant; deterrent; insect predator; flavouring; antibacterial; fungicide; virucide; insecticide.

The consensus sequence of haem-binding domains for microsomal cytochrome P450 homologues was used to design synthetic PCR prinners. The primers may be used in PCR for amplification of peral cytochrome P450 homologues. See also AAR30868-75. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                Nucleic acid sequence encoding a di.hydro:kaempferol-hydroxylating enzyme - e.g. cytochrome P450 introduced into transgenic plants for controlling flavonoid pigmentation in plants and organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides new DNA molecules (AAX60773-X60781) encoding soybean cytochrome P450 enzymes (AAY09183-Y09191) respectively. The Iencoding the cytochrome P450 enzymes is useful for transformation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Soybean, Solanaceae crop plant, cytochrome P450; transgenic plant, enzyme; phenylurea herbicide, herbicide resistance.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a new isolated cytochrome P450 polypeptide. The invention is useful for conferring disease resistance on a plant or plant component. Occamponent conferring disease resistance on a plant or plant component. The cytochrome p450 polypeptide is useful in the biosynthesis of hormones, lipids, and secondary metabolites, and may also help plants tolerate potentially harmful exogenous chemicals such as herbicides, pesticides and pollutants. In addition, the polypeptide is useful in the chemical defense of the plants against insects, as well as against bacterial, viral, or fungal infection. The polypeptide may also be used in the production of insect attractants and deterrents, which may also deter insect pests or attract insect predators, and in generating flavourings. The present sequence is Nicotiana tabacum cytochrome P450 protein conserved domain
                                                                                                                                                                                                                                                                                                                                                                                           New cytochrome P450 polypeptide useful for the biosynthesis of hormones, lipids and secondary metabolites, and in increasing the resistance of plants against harmful exogenous chemicals, e.g. herbicides, pesticides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Solanaceae crop plants. Transgenic plants comprising DNA constructs having the P450 encoding nucleic acid sequences are resistant to phenylurea herbicides. The transgenic plants have increased resistance to phenylurea herbicides compared to wild-type plants of the same species. The plant crops, e.g. turfgrass, tobacco, potato, tomato, corn, rice, cotton, soybean, rape, wheat, oats, barley or rice are particularly resistant to fluometuron, linuron, chlortoluron or diuron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cancer treatment, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding flavone synthase II, useful e.g. for producing transgenic plants with altered flower color or flavone content.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            synthage II (FNSII) which has anticancer and immunocodulatory activity. FNSII catalyses conversion of naringenin to apigenin. (I) is used to produce transgenic ornamental plants that have targeted alterations in flower color, also altered content/distribution of flavones in leaves, flowers and other tissues, e.g. increased resistance properties or symblotic capacity. FNSII expressed by (I) is used in synthesis of flavones that are useful as pharmaceuticals, e.g. in cancer treatment, or as biologically active substances, e.g. to improve the immune defence system. Objequuelocited fragments of (I) are used as probes and primers, or as antisense or ribozyme agents for regulating expression of (II). (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gerbera, transgenic plant; flavone synthase II; FNSII; anticancer;

The invention relates to nucleic acids (AAH79386-AAH80036) encoding polymorphic variants of proteins (AAG98010-AAG98238) related to polymorphic variants of proteins (AAG98010-AAG98238) related to angiopolatin, 4-hydroxybutyrate, dehydrogenses, adenosine triphosphate (ATP)-dependent RNA helicase, major histocompatibility complex (MHC) class I histocompatibility antigen and/or phosphoglycerate kinase. These cucles and single nucleotide polymorphisms (SNR9) and the encoded proteins have potential immunosuppressive, immunostimulatory, critical antirheumatic, antisclerotic, antidiabetic, antinflammatory, cytostatic, antirheumatic, antisclerotic, antidiabetic, antinflammatory, cytostatic, antirheumatic, antisclerotic, antidiabetic, antinflammatory, cuseful in gene/protective and antimicrobial activity and may be useful in gene/protein therapy, vaccines, modulation of the expression and activity of proteins related to angiopoietin, 4-hydroxybutyrate, chistocompatibility complex (MHC) Class I histocompatibility antigen chistocompatibility complex (MHC) Class I histocompatibility antigen and/or phosphoglycerate kinase. Disorders that may be prevented, cliseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus creather brain, breast, colon and kidney, leukemia), diseases of the nervous system, an infection of pathogenic organisms. They may also be conserved and chairsances and craw as longevity, appearance, strength,
                                                                                                                                                                                                                                                                                                                                                                                                                 phosphoglycerate kinase; immunosuppressive; immunostimulatory; antirheumatic; antisclerotic; antidiabetic; antiinflammatory; cytostatic; antileukemic; neuroprotective; antimicrobial; gene therapy; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                               major histocompatibility complex Class I histocompatibility antigen; MHC;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymorphic nucleic acids encoding e.g. angiopoietin, dehydrogenase, adenosine triphosphate-dependent RNA helicase and/or phosphoglycerate kinase, useful for diagnosing and treating, e.g. cancer, autoimmune
                                                                                                                                                                                                                                                                                                                               Human; single nucleotide polymorphism; SNP; angiopoietin;
                                                                                                                                                                                                                                                                                                                                                 4-hydroxybutyrate; dehydrogenase; protein therapy; adenosine triphosphate-dependent RNA helicase;
                                                                                                                                                                                                                                                                                      Human SNP associated peptide SEQ ID NO.

```
The inventors claim a vaccine against HBV which comprises one of AAP50146-P50151 together with one of AAP50152-P50156 and a diluent. They also claim a vaccine which comprises a synthetic polypeptide having an AA residue sequence immunologically corresp. to portions of a sequence of the virus surface antigen (a) from posns. 38-52, and (b) from posns. 110-137, from the aminot terminus, together with a diluent. Other portions of sequences may be similarly used, (see AAP50158, AAP50160, AAP50162). (Updated on 16-AUG-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hepatitis B virus; surface antigen; antibody; radiolabel; enzyme; label;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The peptide is a synthetic peptide specific antigenic determinant region, it is synthesised based on the sequence of a specific antigenic determinant of a desired natural genome. It can be used in the prodn. of antigens which can be used to produce vaccines, diagnostic or therapeutic antibodies etc. The antigens produced are highly specific and free of undesirable impurities.                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                      T helper determinant in the S region of HBsAg from amino acid
                                                                                                                             This radio-labeled or enzyme-labeled peptide is used in the detection of hepatitis B virus surface antigen or antibody. The method involves contacting the sample with the labeled peptide which is normally recognized and bound by the antibody suspected of being present in the sample. The contacted sample is incubated and washed. Staphylococi brotein-A are then added to the contacted sample with the resultant mass being incubated and centrifuged. The radioactivity or enzymatic activity of the resultant pelleted bacteria is then determined. See also AAP60750-7, AAP60759-61. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vaccines comprising anti-idiotype antibody conjugates - induce prodn. of neutralising antibodies against HIV-1 for immunisation against HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention includes epitope-directed immunization with a vaccine in which an anti-idiotype antibody is conjugated to a carrier, which can be either a protein or its derived T helper peptide. The carrier is one

against which the vaccine recipient has previously immunized or otherwise previously exposed, or which enhances the immune response against the anti-idiotype antibody. One exemplary anti-idiotype antibody which induces antibodies against the PND is AB19-4. Where the anti-idiotype induces antibodies against the PND is AB19-4. Where the anti-idiotype or a peptide of either HBsAg or HIV-1 p24 including a T helper or a peptide of either HBsAg or HIV-1 p24 including a T helper or determinant. "PND" = the principal neutralizing determinant ("PND") of spl20. It is known that many individuals in the high risk groups for HIV-1 infection are also at high risk for hepatitis B virus infection. Many people in these groups have already been vaccinated with the hepatitis B virus vaccine using hepatitis B surface antigen (HBsAg). Thus, HBsAg (and related T helper peptides) is a preferred carrier for conjugation with an anti-idiotype antibody which induces production of HIV-1 neutralizing antibodies. (Updated on 25-MAR-2003 to correct PN field.)

The present sequence represents an immunogenic peptide, derived from the S antigen, which is useful for generating antigen specific T cells. It may be used in the course of the invention. The specification describes the use of an agent which regulates cell proliferation for modulating the levels of production of a gene product of interest in a host organism. The method comprises transforming an expandable population of cells with a transgene encoding the gene product, expressing the gene in the host and regulating proliferation of the population of cells by administration of the agent. The method is useful for regulating cell proliferation. The method is also useful for delivering one or more transgenes useful in the disorder, neurodegenerative disorder, atherosclerosis, rheumatological arthritis, osteoporosis, chronic ulcers, psoriasis, raeumatoid arthritis, osteoporosis, directious diseases

The invention relates to an isolated human cytochrome P450TEC (thywns expressed cytochrome) polypeptide or the encoded sequence included in expressed cytochrome) polypeptide or the encoded sequence included in expressed cytochrome) polypeptide or the polymucleotide encoding P450TEC acid can modulate, complement, or species homologue, where the muclaic acid can modulate, or encodes a peptide that modulates care the muclaic acid metabolism and hydroxylation of arachidonic acid metabolism and hydroxylation of arachidonic acid encodes a peptide that modulates can acidity in a biological assay or condition related to P450TEC and for identifying an activity in a biological assay, by expressing cativity in a biological assay and identifying the protein in the activity in a biological assay and identifying the protein in the cypernatant having the activity. The nucleic acid is useful for disease or inflammatory response of a patient or a predisposition to the disease cor inflammatory response of a patient or a predisposition to the disease by detecting a polymorphism in P450TEC gene. P450TEC antibody is cuseful for quantifying the level of P450TEC in a sample and for treating disease or condition related to P450TEC. P450TEC polymucleotides or identifying the level of P450TEC or in sample and for treating cuseful for quantifying the level of P450TEC in a sample and for treating disease or condition related to P450TEC. P450TEC polymucleotides or cyplypeptides are useful as marker or detector of a particular immune system disease or disorder and in treating or detecting autoimmune cypseem disease or disorder and in treating or detecting autoimmune cypseem disease or disorder and in treating or detecting autoimmune cypseem disease and organs. C Goodpasture's Syndrome, Grave's disease, multiple solerosis, myasthenia crejection or graft versus-host disease. Pa60TEC in tomitor program crejection or graft versus-host disease. Sundrome, disease states involving P450TEC or to manitor programs or trierapy. P450TEC attagonistes ar
                                                                                                                                                               Thymus expressed cytochrome; arachidonic acid metabolism; autoimmune disorder; Addison's disease; haemolytic anaemia; rheumatoid arthritis; dermatitis; allergic encephalomyelitis; glomerulomaphritis; Goodpasture's Syndrome; Grave's disease; multiple sclerosis; myasthenia gravis; neuritis; organ rejection; systemic lupus erythematosus; insulin dependent diabetes mellitus; autoimmune inflammatory eye disease; graft versus-host disease; inflammatory disease; infection; septics block; sepsis; SIRS; systemic inflammatory response syndrome; ischaemia reperfusion injury; arthritis; inflammatory bowel disease; Crohn's disease; thymoma; P450TEC; immune system disease; haeme binding motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human cytochrome P450TEC, thymus expressed cytochrome polypeptides for diagnosing, treating autoimmune disorders e.g. Addison's disease, dermatitis, rheumatoid arthritis and identifying modulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  White JA, Ramshaw HA, Stangle WA;
                                                                                                                            Cytochrome P450 haeme binding motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example 1; Page 65; 154pp; English

fruit. The invention also discloses a recombinant construct comprising the novel polynucleotide which when expressed in a plant produces a plant with a parthenocarpic fruit or enlarged fruit. Also disclosed is a isolated polynucleotide encoding a cytochrome P450 or comprising an isolated polynucleotide encoding a cytochrome P450 polypeptide which when expressed in a plant produces a plant with a parthenocarpic fruit or enlarged fruit compared with a plant packing the isolated polynucleotide. The cytochrome P450 polypeptide and polynucleotide of the invention is useful in the production of plants with seedless, enlarged, or parthenocarpic fruits, including vegetable or grain size, leaf size or parthenocarpic fruits, including vegetable or grain size, leaf size or size. The sequences may also be used in increasing plant tissue size to increase agricultural yields of plants, to produce male-sterile plants and to screen for compounds that control parthenocarpy or fruit that the control parthenocarpy or fruit that and to screen for compounds that control parthenocarpy or fruit that the control part that control parthenocarpy or fruit that the control pa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

UYME ) UNIV MELBOURNE Kent SJ;

The invention relates to the use of at least one set of peptides in the preparation of a medicament for modulating an immune response, where individual peptides of a respective set comprise different portions of a mino acid sequence corresponding to a single polypeptide of interest and display partial sequence identity or similarity to at least one other comprise of the same set of peptides (i.e. they are overlapping). Also peptide of the same set of peptides (i.e. they are overlapping). Also cincluded are an antigen-presenting cell which has been contacted with the peptides above and thus presents the peptides, a population of such antigen-presenting cells, a process for producing antigen-presenting cells, a process for producing antigen-presenting cells, a method for modulating an immune response to a polypeptide of interest, a method for modulating an immune response to a polypeptide of interest comprising administering to a patient in need at least one set of the peptides (and a carrier and/or composition) a method for modulating an immune response to a polypeptide of interest contaction associated with the presence of a polypeptide of interest or condition associated with the presence of a polypeptide of interest cand a composition of matter for modulating an immune response in a subject to a target antigen. The polypeptide that is a polypeptide condition-associated polypeptide that is a polypeptide by a pathogenic organism or a cancer, and produced by a pathogenic organism or a cancer, or condition-associated from yeast, viruses, bacteria, helminths, produced by a pathogenic organism or a cancer, colon cancer, post transplant color cancer, stomach cancer, bladder cancer, colon cancer, post transplant color presenting cells or their precureors are useful in the proplem or a medicament for the treatment of a disease or condition is associated with the presenting or a particular presenting or condition is associated where the antigen-presenting of a tarder antigen. Where the antigen-presenting of a tarder an or aberrant expression of a target antigen, where the antigen-presenting cells or their precursors have not been subjected to activating conditions but have been contacted with an antigen that corresponds to the target antigen to express a processed or modified form of the antigen for presentation to the subject's immune system. The present sequence is one of a set of overlapping immunogenic peptides derived from a Hepatitis Use of at least one set of peptides in the preparation of a medicame for modulating an immune response, and for treating cancer or yeast, viral, bacterial, protozoal and mycoplasma infections. invention relates to the use of at least one set of peptides in Disclosure; SEQ ID NO 2045; 645pp; English. B virus protein.
